

ECO · Living & Environment Systems

Sanden delivers energy-conserving, high-efficiency living and environment systems and is actively developing related new businesses.

EcoCute Natural-Refrigerant, Heat-Pump Water Heaters

Sanden's ECO · Living & Environmental Systems business is based on the four product development concepts of "pleasant living environments," "health," "energy conservation," and "peace of mind." Based on these concepts, Sanden has developed and supplies EcoCute water heaters and various other living and environmental systems products. Amid the general trend to all-electric homes, EcoCute products' ability to efficiently use the heat in the air to make hot water has made it a hit household equipment product. In its EcoCute operations, Sanden makes full use of its outstanding

technologies, distribution capabilities, and service network.

Sanden's EcoCute Exhibit at the HVAC&R JAPAN Show

Sanden exhibited its EcoCute products at the HVAC&R JAPAN show held from February 12 through 15, 2008, at the Tokyo Big Sight facility in Tokyo's Ariake district. Sanden's booth at the show, which had the theme "making people's lives more pleasant," also displayed such energy-saving, high-efficiency living and environmental systems products as IH cooking heaters, infrared radiation heaters, and floor-based heating systems.

Central Heating and Ventilation Systems

These are ideal hot-water heating systems that make use of heat radiation and natural flow principles to maintain consistent temperatures throughout houses. In addition, Sanden's ventilating systems expel stale air from the toilet, utility rooms, and other areas of the house, thus keeping air inside the house clean.

Centralized Kerosene Supply Systems

These systems automatically supply kerosene to dwellings in multi-unit housing, just as they receive electricity and gas, thus eliminating the need for tenants in individual units to obtain their own kerosene supplies. The amount used by each unit can be confirmed in a single location.
